

EarZin testimonial Jan. 8, 2012

I purchased my EarZin hearing device back in September 2011. I have a 60% hearing loss in my right ear and moderate hearing loss in my left ear. I've owned several standard, high end hearing aids for the last 4 years and they've been helpful. But I was still having problems hearing conversations in crowds, restaurants, and in meetings. A friend told me about the EarZin hearing device and also mentioned that it was developed by a retired Sandia National Laboratories Physicist, Dr. Garth Gobeli. Dr. Gobeli developed the model that I purchased specifically for persons with "age-related" hearing loss.

I scheduled an appointment to see and evaluate the EarZin for myself. I was so impressed that I purchased mine device that same day. I like the fact that I can easily adjust the amplification in each ear separately. With this device I can now hear clearly with "both" of my ears. My old right hearing aid could never develop enough amplification to allow me distinguish words consistently with that ear alone. For example, if I purposely blocked the sound from my good ear, my right ear hearing still sounded like a poorly tuned-in radio station from a distant city even with the assistance of my hearing aid for that ear. In social situations or even while trying to converse with another person in a car, I'd frequently need to turn my head toward anyone on my right side in order to understand them. Now, while wearing my EarZin hearing device, I clearly understand people speaking to me who are sitting or standing to my right without having to turn and ask them to repeat what they just said.

I'm very satisfied with my EarZin hearing device. I wear the EarZin on a lanyard around my neck and I've learned to adapt to it fairly well while doing most of my normal activities. I still wear my other hearing aids occasionally (e.g., while playing golf) but I always prefer my EarZin for going to movies, parties, restaurants, meetings,

and when listening to music in my home.
